Capture the screen and save it to the Clipboard This lightweight tool places an icon in System Tray, and through it lets you instantly capture a specific area every time you click it. In addition to that, you should know that the app does not save the captured screenshot as a separate image file on your computer, yet it copies it to Clipboard to allow you to paste it in any graphic editor you may use. Set up keyboard shortcuts and copy images as an HTML This software tool also provides a bunch of configuration options, yet nothing too fancy or so difficult to get beginners into trouble. For example, you are allowed to set up the stroke width, the stroke color and the hotkey you wish to use to take a screenshot on the go. Last but not least, Snippy lets you copy the captured area as an HTML and define the behavior of the "Shift+drag" combination, which can either enable you to capture a rectangular region or a freehand one. A final evaluation Although it is designed to run all the time, Snippy works without a flaw on all Windows workstations without slowing down the system at all, which makes it suitable for both newer and older computers. Overall, Snippy is a basic capture tool that does exactly what it says and nothing more. Nonetheless, the fact that it cannot save the captured area as a separate image file is a major setback. Isolation of dicentric chromosomes and chromosome fragments from natural or experimental murine tumors. Using a magnetic micromanipulator and classical cytogenetic techniques, dicentric chromosomes (containing both a chromosome and its counterpart inverted) are frequently found in human cancer cell lines. They are thought to arise from chromosomal abnormalities in which a reciprocal translocation occurs, forming a new centric and an acentric chromosome. Such an event is either random or may be selected by a chance to benefit from the activation of an overexpressed oncogene. Cells originating from such an aberration may retain a partial or whole extra chromosome and may survive in vivo to establish a tumor. In this study we developed a method to produce murine dicentric and tetrasomic chromosomes and to evaluate their occurrence in spontaneously occurring and transplanted tumors. Tumor cells from C3H/He and BALB/c mice and cultured lymphomas and leukemias from each of the three parental strains were examined for the presence of dicentric chromosomes and chromosome fragments by Giemsa staining of metaphases and in situ hybridization with biotinylated chromosome paint. The incidence of dicentric chromosomes and chromosome fragments was higher in the spontaneously occurring tumors from the C3H/He mice (16%-27%) than in the transplantable tumors derived from the parent strains (0%-3%). Murine tetraploidy was also observed in all tumors. The in situ hybridization technique was suitable for the detection of dicentric chromosomes and chromosome fragments, but did not detect random centric tetraploidy. The data illustrate the usefulness of the method to examine chromosomal aberrations in natural tumors and its limitations for detection of random events..
